Week 7 Project Summary

HealthConnect Rwanda | Data Analytics track | Okoro Joseph Ifeanyichukwu

#	Item	Summary
1	What I planned to test	Whether the Week 6 numbers are right, whether the dashboard works, and whether the main findings hold up; plus one check with another track
2	What I actually tested	120 tests: files vs Power BI (34), numbers re-calculated (42), database vs second method (8), dashboard (17), filters (1), findings (18)
3	Most important results	38 of 39 KPIs matched exactly; 13 of 13 dashboard cards matched; database and independent code agreed on all 8 totals; 102 of 120 tests passed
4	Issues and weaknesses	One wrong number (poor ratings: 40.4%, not 40.5%); 5 findings could be chance (hospital, department and province rankings, disease trend); 4 charts not showing; 10 of 36 filter and card pairs do not respond; ratings disagree with comments in 6,336 records; no attendance field
5	Improvements made	Fixed the number everywhere; removed or reworded weak findings; hospitals are only flagged when the gap is clearly not chance; small tables are marked; notes added; Power BI version 2 built with the fixes
6	Retesting results	Poor-rating number: new files show 40.4% only. Hospital flags: 0 of 20 flagged (was 4 red). Dashboard fixes still need retest screenshots in Power BI. Other-track retest: none reported
7	Tracks collaborated with	Project Management (Manal El khalifi, Project Manager); the model results she shared come from the Data Science work
8	What was tested collaboratively	Her claims model (accuracy 50.1%) and triage model (emergency recall 9.7%) results against validated facts from the cleaned data
9	What changed as a result	So far: claims accuracy near 50% is explained by the data (approval is 50/50 and flat across every field). She acknowledged the results (2 Nov) but reported no changed result, so there was no numerical retest
10	Key findings and validation outcomes	Kept: RWF 919.9 M unpaid, half of 42,036 claims pending, identical staffing. Removed: busiest hospitals least liked, ICU worst, Kigali City lowest use, hypertension rising
11	Major challenges	The brief describes attendance data that our Rwanda dataset does not contain; only 5,000 of 60,000 appointments have hospital detail; the Power BI project needed manual repair
12	Important decisions	Continue on the Rwanda Week 6 work (DL-01); recalculate with independent code (DL-02); correct and keep originals (DL-03); withdraw unsupported findings (DL-04); keep future-dated rows but flag them (DL-05); record cross-track results only when they happen (DL-07, DL-09)
13	Remaining limitations	Few ratings per hospital (70 to 100); ratings not confirmed; Revenue Summary does not match billing; no hospital names or types
14	Remaining issues and dependencies	Dataset decision (attendance data); full appointment list; dashboard retest screenshots; saved .pbix and PDF
15	Contribution to HealthConnect	Numbers the team can rely on, a list of what cannot be trusted yet, a tested dashboard, and a data explanation for the claims model result
16	To complete before Week 8	Resolve dataset scope; obtain full appointment data; re-run the finding tests; take after screenshots and save the .pbix and Executive Dashboard PDF; re-run the claims test if her target changes; update README and GitHub

Main deliverable: **HealthConnect_Week7_Analytics_Testing_and_Refinement_Report.pdf**. Evidence: Week7/Logs, Week7/Evidence, Week7/Notebook, Week7/Code. This summary does not repeat the report.
